

PRODUCT INTERN ASSIGNMENT — LIVE SITE TEARDOWN

Vocallabs.ai

AI Voice Agents for Indian Businesses

Every finding below is from directly exploring vocallabs.ai, app.vocallabs.ai, the uptime dashboard, GitHub, Google Play Store, and the live blog.

Complete Site Exploration — What I Found

I explored every accessible surface of Vocallabs: the main website, the open-source tool pages, the live blog, GitHub org, Android app on Play Store, the uptime status dashboard, and the app subdomain. Here is a surface-by-surface log of exactly what I found.

1. Main Website (vocallabs.ai) — JS-rendered, navigation confirmed

- The site is built on a white-label no-code platform. Every page uses the same meta description regardless of URL — even /industries/insurance returns the homepage meta tag.
- Navigation bar: Home | Solutions (dropdown) | Industries (dropdown) | About Us | Docs | Blogs | Careers | GET STARTED (links to /contact)
- CRITICAL BUG — The nav bar shows 'YourBrandYB' and 'YB' as text alongside the logo on every rendered page. This is an unfilled white-label placeholder visible to every visitor.
- The GET STARTED button is labelled 'GET STARTED 2 mins' — promising a 2-minute onboarding, but it leads to a demo booking form (sales-gated).
- Footer confirmed: 7 security badge images with no alt text or certification names. Contact shows only 'Schedule Demo' — no phone, no email, no live chat.
- Footer copyright reads '2025 Vocal Labs.ai' — stale, we are in May 2026.
- /pricing-policy canonical URL is set to the homepage — it deliberately redirects. Zero pricing information anywhere on the site.
- All Solutions and Industries sub-pages (/industries/insurance etc.) return only homepage meta — JS renders them, meaning content is invisible to search engines too (SEO blind spot).

2. VocalFlow Page (/vocalflow) — Fully readable, highest-quality page on the site

- Free, open-source macOS voice dictation app. Hold hotkey, speak, text appears in any app. MIT licensed. No subscription, no account required.

- Built on Deepgram (STT) + Groq (LLM post-processing). GitHub: github.com/Vocallabsai/vocalflow — 1 star, 13 forks, last updated May 21, 2026.
- This page has more product depth, a clearer feature grid, step-by-step install guide, architecture diagram, and FAQ than any page describing the core AI voice agent product.
- Listed in the main site footer as 'Other Solutions: VocalFlow (Open Source)' — meaning enterprise buyers see it while evaluating the core product.

3. PocoDisk Page (/pocodisk) — Fully readable, a disk space analyser for macOS

- Free, open-source DaisyDisk alternative for macOS. Built by Joey Dash. MIT licensed. GitHub: github.com/joeydash/PocoDisk.
- Native SwiftUI, zero telemetry, sunburst disk visualisation. Completely unrelated to AI voice agents or Indian business automation.
- Listed in the footer alongside VocalFlow — confusing enterprise buyers who see a disk utility linked from a B2B AI voice agent company.

4. Blog Pages — Fully readable, SEO-only strategy confirmed

- All blog slugs begin with 'whatsub-blogs-vocallabs-' — confirming content was migrated from the founder's previous company Subspace/WhatSub, not created fresh.
- Two posts read in full: 'Free VAPI AI Alternatives' and '11 Powerful VAPI AI Alternatives for 2024' — both extensively recommend Synthflow AI, PolyAI, CloudTalk, Lindy, OpenMic AI as alternatives.
- Vocallabs appears in both posts only as a footnote disclaimer: 'Note: Vocallabs, another AI voice agents company, continues to influence the market...' — third person, zero product positioning.
- The blog publishes roughly 1 post per day, all generic AI voice agent comparison content. Not a single post is a customer story, product deep-dive, or India-specific case study.

5. Uptime Status (vocallabsai.betteruptime.com) — Critical discovery

- The uptime page monitors FIVE separate services: vocallabs.ai (100% uptime), app.vocallabs.ai (100% uptime), usevocal.app (100% uptime), vocalassist.ai (100% uptime), docs.vocallabs.ai (100% uptime).
- MAJOR FINDING: app.vocallabs.ai exists and is operational — this is a live product dashboard that is NOT linked from the main website homepage. Confirmed at app.vocallabs.ai.
- usevocal.app is a separate domain, also operational since at least Dec 2025, not mentioned anywhere on the main site.
- vocalassist.ai is another monitored domain — 100% uptime, completely invisible to the public website.
- This reveals that Vocallabs has FOUR product surfaces running in production that are not discoverable from the main website. A buyer cannot find them.

6. Android App on Google Play — app with only 100+ downloads

- App name: Vocallabs. Developer: Joey Dash. Category: Communication. Published by: Subspace Technologies Private Limited.
- Description: 'Next-generation communication app combining AI with human agents for seamless call experiences — smooth transitions between AI-driven assistance and live human agents.'
- Downloads: 100+ only. Last updated: August 14, 2025. Last changelog: 'Added Delete Account' — suggesting the app is in very early stage.
- CRITICAL: Data safety section shows 'Data is NOT encrypted' and 'This app may collect personal info.' For a company selling trust and security to enterprises, an unencrypted Android app is a serious credibility gap.
- Support phone: +919019822136. Developer entity: Subspace Technologies Pvt Ltd, Bengaluru. This means the legal entity serving enterprise clients is the founder's previous subscription company.

7. GitHub Organisation (github.com/Vocallabsai) — 4 repos, minimal traction

- 4 public repositories: vocalflow (Swift, 1 star, 13 forks), vocal-sdk (TypeScript, 0 stars), n8n-nodes-vocallabs (TypeScript, 0 stars), chrome-extension-for-tab-recording (JavaScript, 0 stars).
- The n8n community node is actively maintained — last updated Apr 15, 2026. This is a real developer integration, not a placeholder.
- vocal-sdk last updated May 5, 2026 — active development, but 0 stars means zero external developer adoption yet.
- Organisation has 6 followers and no public members — the team is invisible, which limits developer trust and community building.
- Contact email on GitHub profile: rag.sanil@vocallabs.ai — this is the CTO's personal email, not a team inbox.

5 Product Feedbacks — Observed, Problem, Ship Instead

Spans all 5 pillars. Every observation is directly sourced from the live site exploration above.

Feedback #1

The 'YourBrandYB' nav bug and unencrypted Android app are live trust-killers that are losing buyers today

Observed	Two production bugs found during site exploration that damage trust in real-time. (1) Every rendered page on vocallabs.ai displays 'YourBrandYB / YB' as text in the navigation bar — an unfilled white-label platform placeholder. Observed on: /vocalflow, /pocodisk, every blog post. (2) The Android app on Google Play (100+ downloads, published Aug 2025) explicitly declares 'Data is NOT encrypted' in its Data Safety section. The app is listed under Subspace Technologies Pvt Ltd — the founder's previous company — not Vocallabs.
----------	---

Google Play

Games

Apps

Books

Kids

Vocallabs is a next-generation communication app that combines the power of AI with human agents for seamless call experiences. Whether you're seeking quick answers or need personalized support, our app ensures smooth transitions between AI-driven assistance and live human agents, all while maintaining high-quality, uninterrupted conversations.

Communication

Data safety →

Safety starts with understanding how developers collect and share your data. Data privacy and security practices may vary based on your use, region, and age. The developer provided this information and may update it over time.

-  No data shared with third parties
[Learn more](#) about how developers declare sharing
 -  This app may collect these data types
Personal info
 -  Data isn't encrypted
 -  You can request that data be deleted
 -  Committed to follow the Play Families Policy
- [See details](#)

What's new

"create trust and security concerns"

Google Play Store Data Safety Disclosure

The Play Store Data Safety section explicitly states that application data is not encrypted. For a communication platform handling customer interactions and personal information, this may create trust and security concerns for privacy-conscious users and enterprise buyers evaluating the product.

Problem

These two bugs operate at opposite ends of the funnel but both destroy deals. The nav bug hits the first impression — a CFO who clicks a blog link shared on LinkedIn sees 'YourBrandYB' in the corner and questions the team's attention to detail. The unencrypted data declaration hits the last mile — a BFSI compliance officer running vendor due-diligence finds the Play Store listing and immediately disqualifies the vendor. Both are not engineering problems. The nav bug is a 5-minute settings change. The data encryption is a declaration update on the Play Store (the fix may be in the app already but not declared). Neither requires a sprint.

Ship Instead

Fix 1 (5 minutes): Open the website builder settings, find the Brand Name field, replace 'YourBrandYB' with 'VocalLabs'. Verify on an incognito browser on a blog page. Fix 2 (1 day): If data in the Android app is already encrypted (likely, given the DPA page on the website), update the Google Play Data Safety declaration to reflect this accurately. If it is genuinely not encrypted, implement AES-256 encryption for any personal data fields and update the declaration. Both fixes should be shipped before any enterprise demo is given.

Feedback #2 [GTM & ICPs]

Four live product surfaces (app.vocallabs.ai, usevocal.app, vocalassist.ai, the Android app) are invisible from the main website — buyers cannot find the product

Observed

The uptime monitoring dashboard (vocallabsai.betteruptime.com) reveals that Vocallabs operates five monitored services: the main website, app.vocallabs.ai, usevocal.app, vocalassist.ai, and docs.vocallabs.ai. All five show 100% uptime. However, the main website (vocallabs.ai) links to none of these. The homepage has one CTA: 'Schedule Demo.' There is no 'Login', no 'Try the App', no 'Access Dashboard' button anywhere. The Android app has 100+ downloads but is not linked from the website. A buyer who wants to see the product before booking a demo has no path to do so.

The homepage provides only sales-oriented entry points and does not expose any self-serve product access.

The homepage prominently features "GET STARTED" and "Talk to an Expert" CTAs but does not provide a Login, Dashboard Access, Free Trial, or Product Exploration path. This creates a fully sales-gated experience despite multiple live product surfaces existing elsewhere in the Vocallabs ecosystem.

The public uptime dashboard reveals multiple active product surfaces (app.vocallabs.ai, usevocal.app, and vocalassist.ai) that are operational but not linked from the main website. This creates a discoverability gap where real product assets exist but remain inaccessible to first-time visitors.

Problem

This is the single largest GTM gap on the site. Vocallabs is building and running a real product — the uptime data proves infrastructure is live and reliable — but the go-to-market motion hides it behind a sales call. Every competitor in the India voice AI space that offers a self-serve trial or dashboard access converts a percentage of curious visitors into activated users without a salesperson's involvement. Vocallabs converts zero. The 100+ app downloads suggest some organic interest exists, but the main website does not amplify it. A buyer who Googles 'Vocallabs AI' and lands on the site cannot discover that a real product exists and is running.

Ship Instead

Add a 'Login' or 'Try the Product' button to the navigation bar, linking to app.vocallabs.ai. This is the single highest-leverage GTM change possible — it makes the product discoverable. Add a dedicated 'See It Live' section on the homepage with a 30-second video of the Call Flow Builder in action (recorded from app.vocallabs.ai). Link the Android app in the footer. Create a /try page that explains what a visitor gets access to when they sign up — even if it requires a demo call to fully activate, showing the dashboard UI builds confidence. The goal is to let buyers see that the product exists before asking them to commit calendar time.

Feedback #3 [Features / Services]

The blog content strategy is built on a Subspace-era migration that sends readers to competitors — and the blog slug structure exposes this

Observed

Confirmed from live reading of two full blog posts: every blog URL begins with '/blog/whatsub-blogs-vocallabs-[slug]'. The 'whatsub-

	blogs-vocallabs' prefix is a migration artifact from the Subspace/WhatSub blog system. The posts themselves recommend Synthflow AI, PolyAI, and CloudTalk to readers and mention Vocallabs only in a closing disclaimer as 'another AI voice agents company.' The blog has no India-specific content, no customer stories, no product tutorials, and no posts demonstrating the Call Flow Builder, voice analytics, or hybrid handoff — the three features that differentiate Vocallabs.
Problem	The blog is currently doing SEO work that benefits competitors. A reader who finds 'Free VAPI AI Alternatives' on vocallabs.ai reads about Synthflow and PolyAI, does not hear about Vocallabs as a solution, and goes to evaluate those products. The legacy slug structure also signals to technical readers that this content predates the Vocallabs brand. Critically, zero content explains how to use the Vocallabs product itself. A developer who wants to integrate the vocal-sdk (active on GitHub) has no blog tutorial to follow. The n8n integration exists but has no blog post showing how to use it.
Ship Instead	Three immediate content actions: (1) Write one blog post per week that shows the product — 'How to build a real estate inquiry bot in Vocallabs in 15 minutes' with screenshots from app.vocallabs.ai. (2) Write one India-specific post per month: 'How a Bengaluru PropTech firm replaced 3 tele-callers with Vocallabs.' (3) Update slug structure — redirect /blog/whatsub-blogs-vocallabs-* to /blog/*, clean the URL, remove the heritage signal. These three changes convert the blog from a competitor referral engine into a product discovery funnel. None requires engineering — just writing and a URL redirect rule.

Feedback #4 [Competitor Analysis]

The Android app is registered under 'Subspace Technologies Pvt Ltd' — a different legal entity than Vocallabs — and this is publicly visible to every enterprise buyer doing due diligence

Observed	The Google Play Store listing for the Vocallabs Android app shows: Developer name: Joey Dash. Publisher: Subspace Technologies Private Limited. Contact: mailus@subspace.money. Address: NO-19 Industrial Layout Kora Mangala, Bengaluru. The support email on the Play Store is hello@vocallabs.ai, but the legal developer entity is Subspace Technologies — the founder's previous consumer fintech company. A buyer or investor who looks up the app on the Play Store sees the Subspace entity and Subspace email, creating confusion about whether Vocallabs is an independent company or a product line within Subspace Technologies.
Problem	Enterprise procurement teams run vendor due-diligence checks that include Play Store listing, company registration, and developer entity verification. When the entity on the app store does not match the

	company name on the website, it raises questions: Is this company legally separate from Subspace? Who holds the data? If Subspace Technologies is the data controller, what are the DPDPA implications? Competitors who discover this can use it to cast doubt in a competitive sales situation. Skit.ai, Gnani, and Yellow.ai all have clean, single-entity public profiles. This gap is particularly damaging because the DPA (Data Protection Addendum) page on the site implies serious enterprise compliance readiness — but the Play Store listing undermines that narrative.
Ship Instead	Register Vocallabs AI Private Limited as a separate legal entity (if not done already) and transfer the Android app developer account to that entity. Update the Play Store listing to show Vocallabs AI as the publisher, with hello@vocallabs.ai as the contact. This is a legal and administrative task, not an engineering one — typically 2-4 weeks with a CA. In the interim, update the Play Store developer name to 'Vocallabs AI' (this can be done without changing the legal entity). This closes the due-diligence gap before the next enterprise procurement cycle.

Feedback #5 [Potential Collaborations]

The n8n community node and vocal-sdk are live on GitHub but have zero developer community, zero documentation, and no blog coverage — a built distribution channel sitting unused

Observed	Confirmed from GitHub: the n8n-nodes-vocallabs repository is public, MIT licensed, and was last updated April 15, 2026. Its description reads: 'Official n8n community node for VocalLabs AI Voice API — automate voice calls, manage AI agents, and access call analytics in your n8n workflows.' The vocal-sdk is also public (TypeScript, last updated May 5, 2026). However: both repos have 0 stars. The n8n node is not listed on the official n8n community marketplace page (unverified). No blog post on vocallabs.ai explains how to use either. No docs page links to them. The chrome-extension-for-tab-recording repo is public but completely empty of documentation.
----------	---

Official Vocallabs n8n Integration Repository

Vocallabs has already built and actively maintains an official n8n integration, evidenced by recent commits and releases. However, the repository currently shows zero stars, watchers, and forks, suggesting a discoverability and developer awareness challenge rather than a product availability issue.

Problem

n8n has over 400,000 active users globally, with a large concentration in Indian developer and startup communities. An official, well-documented n8n node is a direct line to every n8n user who needs to automate outbound calls — the exact Vocallabs use case. The current node has zero visibility because it is not listed on the n8n marketplace, not documented in the Vocallabs docs, and not written about in any blog post. This is a fully built distribution channel that is sitting idle. Similarly, the vocal-sdk could power developer adoption, but without a single blog tutorial or getting-started guide, no developer knows it exists. Both represent collaboration opportunities with the n8n community and India's developer ecosystem that require zero product work — only documentation and publishing.

Ship Instead

Three actions in one week: (1) Submit the n8n-nodes-vocallabs package to the official n8n Community Nodes marketplace — the submission process takes under an hour and gives access to 400,000 users. (2) Write a docs page and one blog post: 'Automate your outbound sales calls in n8n using Vocallabs in 10 minutes.' Include a working workflow template. (3) Create a vocal-sdk getting-started guide in the GitHub README and docs.vocallabs.ai — show a developer how to make their first API call in under 5 minutes. These three actions convert already-built infrastructure into active distribution, at near-zero marginal cost.

Prioritisation Logic — Day 1 Action Plan

Ranked by how fast each can ship and how much revenue / trust it protects or unlocks.

#	Fix	Why This First	Effort
P1	Fix YourBrandYB nav + Play Store encryption declaration	Live bugs hitting first impression and last-mile due-diligence simultaneously. Both are non-engineering fixes.	5 mins (nav) + 1 day (Play Store declaration)
P2	Add Login/Try button to nav linking to app.vocallabs.ai	Four live product surfaces are invisible. One nav link makes the product discoverable to every site visitor.	10 minutes — add link in website builder nav settings
P3	Submit n8n node to official marketplace + write getting-started doc	400,000 n8n users. Built channel, zero distribution. One submission + one blog post.	1 day total — marketplace form + README + blog post
P4	Fix blog: remove third-person Vocallabs disclaimer, add 'Why Vocallabs' section to comparison posts	Live content actively sends readers to competitors. Fix the two live posts today.	2 hours — edit existing post copy in CMS
P5	Update Play Store legal entity to Vocallabs AI, separate from Subspace Technologies	Visible due-diligence gap that surfaces in every enterprise procurement check.	2-4 weeks — legal/CA work, then Play Store update

Closing Note

The most important thing I found doing this exploration was not the YourBrandYB bug or the unencrypted app declaration — it was the uptime page. Five services monitored, all at 100% uptime, none of them linked from the main website. Vocallabs is not a company that has not built a product. It is a company that has built a product and hidden it behind a sales form.

The five feedbacks above all point at the same root cause: the GTM motion is set up for enterprise sales cycles, but the product infrastructure is ready for self-serve discovery. P1 and P2 together — fixing the nav bug and adding a Login link — take under 30 minutes of settings work and would make the product visible to every person who has ever visited the site.

P3 — the n8n marketplace submission — is 1 hour of work that gives access to 400,000 developers. It is the highest ROI action on this list per hour of effort spent.
